

Development

The Duplo models with reinforced toe area have been developed in close cooperation with the Miller Ranch in Arizona. Being used for climbing over rocks at high temperatures, the horseshoe is particularly strained in its toe area. The biggest challenge was therefore to prevent the synthetic material in this area from prematurely tearing.

Structure

In order to increase the horseshoe's tear resistance in its toe area and therefore to prevent the synthetic material in this area from prematurely tearing, we have bordered the toe area with steel.

Thanks to the synthetic material, the shock absorbance is still granted; however, the synthetic material is better protected by the additional steel border.

Please Note:

- If the steel border in the toe area is visible after some time, this is **no** wearout but completely normal. Still, it doesn't necessarily mean that the
- horseshoe can be used for another shoeing period.

- Because of the additional steel border, the risk of injuries in herds is bigger than in case of other Duplo models.

For Comparison:

Extra Clipped
and Profiled

Extra Arizona

Wearout

The following horseshoe doesn't have to be removed. It also could be used for another shoeing period.

For comparison: This horseshoe doesn't have to be removed either. However, it should **not** be used another time because there is **no profile left** in the toe area, for example.

Disciplines

We particularly recommend the Duplo model Arizona for rocky trails or if the horse's movements are slightly to be improved by a little additional weight in the toe area.

The Duplo Arizona might be interesting for the following applications:

- Dressage Horses — Gaited Horses — Carriage Horses — rocky trails

Cross Section
